Symbol	Function
<u>C1</u> <u>C2</u> <u>C3</u> <u>C4</u>	<p>Provides keyboard scanning .</p> <p><b>a. Keyboard scanning:</b></p> <p>HKS pin is LOW, the column group stays in "HIGH" stays and row group stays in "LOW" state.</p> <p>The key pad is compatible with the standard dual contact matrix keyboard (as Figure 1b.), the inexpensive single contact keyboard (as Figure 1a.), and electronic input (as Figure 1c.).</p> <p>When HKS is "low", a valid key entry is defined by related Row &amp; Column connection or by electronic input; (as show in Figure 1c).</p>
<u>R1</u> <u>R2</u> <u>R3</u> <u>R4</u>	<p>Activation of two or more keys will result in no response, except for single key.</p> <p>To avoid keyboard bouncing error, this chip provides built-in debounce circuit. (The debounce time = 20 ms.)</p>

	<p>Figure 1b : Dual contact form keyboard configuration</p>
<u>OSCI</u> <u>OSCO</u>	<p>Oscillator input &amp; Oscillator output pins.</p> <p>The 3.579545 MHz oscillator is formed by a built-in inverter inside of this chip and by connecting a 3.579545 MHz crystal or a ceramic resonator across the OSCI and OSCO pins. (built-in feedback resistor and capacitor)</p> <p>When <u>HKS</u> is "low", a valid key-in may turn on this oscillator and generates a 3.579545 MHz clock.</p>
<u>XMUTE</u>	<p>Mute output pins.</p> <p>NMOS open drain output structure.</p> <p>The output is in "low" state during dialing sequence (both Pulse and Tone mode) otherwise this pin is "high-impedance".</p> <p>Long (continue) Mute.</p>
<u>V<sub>SS</sub></u>	Negative power supply pin.
<u>V<sub>DD</sub></u>	Positive power supply pin.
<u>HKS</u>	<p>Hook switch input pin.</p> <p>When the handset is in ON-HOOK state, this pin must be pulled "high" in order to disable the dialing operation and decrease the power consumption.</p> <p>When in OFF-HOOK state, the HKS pin must be pulled "low" state for all function operation.</p>
<u>PO</u>	<p>Pulse output signal pin.</p> <p>NMOS open drain output structure.</p> <p>The output is "low" during pulse dialing and Flash operation, otherwise this output is "floating".</p>

Symbol	Function
TONE	<p>Dual Tone Multi-frequency output pin.</p> <p>In TONE mode, when a entry of digit key (include * , # key), this pin will sent out a corresponding DTMF signal.</p> <p>The TONE pin provides minimum tone duration (<math>t_{TD}</math>),&amp; minimum intertone pause time to support rapid key-in. If key-in time is less than <math>t_{TD}</math> , DTMF signal will last for <math>t_{TD}</math> , otherwise the tone duration will last as long as the key is pressed.</p>
HFI	<p>Handfree input control pin.</p> <p>Toggle input structure, falling edge trigger.</p> <p>It is used to enable and disable Handfree function.</p> <p>With waveshaped by a built-in Schmit trigger, the bounce of input can be eliminated by external R, C debounce circuit.</p> <p>A built-in pull up resistor is 200K typical.</p>
HFO	<p>Handfree output pin.</p> <p>Inverter output structure (normally "low", active "high").</p> <p>When a HFI pin is active, Handfree function will be enabled (HFO=1) or disabled (HFO=0).</p> <p>When the Handfree function is enable (HFO=1), after OFF-HOOK action, it can reset Handfree function and HFO pin return to "low" state.</p>
