SAW Filters Introduction

Surface Acoustic Wave (SAW) Filter Applications

RFM designs and manufactures bandpass filters, delay lines, and notch filters, for a wide range of wireless telecommunication and data communication applications. We provide standard IF filters from 61 MHz to more than 1 GHz in surface-mount, dual-in-line (DIP) and TO39 packages. Our filter products offer a wide range of bandwidth, low insertion loss, low amplitude and group delay ripple, small size and high out-of-band rejection. In addition to our standard product offering, RFM provides custom filter design services for high volume applications that include cellular handsets, base stations, and repeaters (including the current standards GSM900, DCS1800, PCS1900, CDMA, TDMA and AMPs, DECT, and the next generation standards EDGE, WCDMA and CDMA2000), global positioning system (GPS), satellite and microwave radio, wireless local loop (WLL), wireless local area networks (WLAN), multimedia and fiber-optic transmission equipment.

Filter Specifications

Unless otherwise noted in the tables, RFM references bandwidths, rejection levels and group delay deviation limits with respect to the operating frequency of the filter. Manufacturing tolerances and temperature drift effects over the filter's operating temperature range are included in these specifications already (customers do not need to add any additional tolerances). RFM filters are characterized in test fixtures that match the filter to 50 Ω . Data is taken on a Hewlett Packard 8753 series network analyzer (or equivalent) with proper calibration.

Filter Matching and Layout Considerations

Filter matching involves transferring source and load impedance to the values needed at the input and output of the filter for proper operation. Most filters require different impedance values to match the input and the output. One common network topology used to match a SAW filter port to 50 Ω consists of a shunt capacitor across the 50 Ω impedance with a series inductor from this node to the filter port, as shown in Figure 1.

Figure 1

Low-loss SAW filters (less than about 17dB) can be matched using a network analyzer by transforming the filter's input and output reflection coefficients (S11 to S22) to approximately 50 Ω around the center frequency of the filter. SAW filters designed to operate with high insertion loss (higher than about 18dB) may need to be deliberately mismatched to reduce the passband ripple. RFM can provide matching component values for a number of matching network topologies, either for 50 Ω source and load impedances or for specified source and load impedance. Contact RFM's applications engineering group for assistance.

Please recognize that we have performed the match on our test fixture and demo board, which do not represent the parasitics of your PCB, so use our matching component values as the starting point only (you may need to adjust the matching on your PCB).

Matching network component values vary somewhat with circuit board layout, especially at frequencies above 200 MHz. Component values can be optimized by "rocking" them above and below nominal values to minimize amplitude and group delay ripple. Using matching network inductors with Qs below 30 can lead to excessive insertion loss and should be avoided. We also recommend that customers use matching components with a tolerance of 5%, or lower, if possible.

Achieving good ultimate rejection with a SAW filter depends on two things: avoiding stray coupling and avoiding ground loops. Stray inductive and capacitive coupling can occur between matching components, and between input and output circuit board traces. Inductors used in input and output matching networks should be oriented at right angles (or make sure their fluxes are perpendicular to each other) to minimize inductive coupling. Some designers mount the input and output matching components on opposite sides of the circuit board, taking advantage of the circuit board ground plane to provide shielding.

Ground loop coupling occurs when the input and output circuits of a filter share a common circuit trace. If RF currents flowing in the input circuit of the filter share any common length of circuit trace with the filter's output circuit, significant broadband RF energy can be coupled between input and output through this common impedance, compromising the filter's ultimate rejection.

Dual-in-line package (DIP) filters perform best when input and output connections are returned through the closest corresponding ground pin to minimize the current loop. In some instances, breaking the ground plane, as shown in Figure 2, will minimize ground loop currents and improve the filter's rejection.

Isolating Filter Input/Output Currents

Figure 2

Surface-mount (SMT) package filters tend to be less layout critical with respect to ultimate rejection, provided ground returns are kept as short as possible. It is recommended that enough random grounding via holes be placed on the PCB under and around the SAW.

Filter Simulation Tools

RFM offers tuned S-parameter files for most of its filters in HP/EEsof compatible format. Files are available in both Unix and DOS formats, and can be provided on disk or sent via e-mail.

For further information contact RFM's applications engineering group. Also, visit RFM's website at www.rfm.com for further information on our filter products.

SAW Filters By Nominal Center Frequency

Nominal Frequency (MHz)	Typical Application (Actual may vary)	RFM Part Number
61	WLL	SF1137A
70	CDMA	BP1042

SAW Filters Selection Guide Notes

*New Parts

These parts are currently under development. Please see the RFM website (www.rfm.com) for up-to-date information.

Notes:

1. With the exception of the BP1045A, BP1051, SF1058-T, and SF1065-T, all of these filters require external impedance matching (not included). BP1045 bandwidth is shown for reference only. The 50 ohm loaded Q (3dB) is specified as 700 (min) and 900 (max).
2. The SF1058-T is an internally impedance matched (tuned) version of the SF1058.
3. Minimum 3dB bandwidths and insertion loss specifications shown here are approximate and are provided solely for the purpose of comparison among different filters. The nature of the individual filter specifications may be inconsistent with this form of direct comparison. Individual filter specifications take precedence in the event of any conflict with this short-form catalog.
4. See individual specification sheets for detailed specifications. All specifications are subject to change without notice.
5. See Low-power products short-form catalog for information on RF series filters.
6. These devices are covered by one or more of the following U.S. Patents: 4,353,046; 4,454,488; 4,491,757; 4,616,197; 4,902,925; 5,073,763; 5,051,644; 5,061,871; 5,374,908, and others pending.

Optical Timing Products Introduction

RFM retains a long history of providing stable, SAW based frequency control products for computer timing, analog communications, test instrumentation and military applications. Today, RFM also designs and manufactures optical timing products based on our patented "Diff Sine" technology to meet the increasing demand for bandwidth in communication systems. These products have been specifically developed for applications such as dense wave division multiplexing (DWDM) equipment where timing integrity and elimination of system noise in circuits are critical. Example applications include:

- Synchronous Optical Network (SONET)/Synchronous Digital Hierarchy (SDH) Equipment
- DWDM Backbone Timing and Recovery
- Terabit Routers

The OP4005 is a 622.08 MHz differential clock with near perfect symmetry and extremely low jitter with or without noise on the power planes. The OP4006 is a 666.5 MHz Clock for forward error correction timing. RFM's "Diff Sine" architecture, shown below, is the basis of each of these high performance optical products. Parts under development include the OP4004 product, centered at 625 MHz, for 10 GBit Ethernet timing.

Contact the local RFM Representative in your area or RFM directly for more information. Also, visit RFM's website at www.rfm.com for further information on all of our products.

Voltage Controlled Differential Sinewave Clock

Optical Timing Products Selection Guide

RFM Part No.	Nom. Freq. (MHz)	Typical Application	Tune Range (ppm)	Tuning Linearity	Jitter p-p	Power Supply Current 3Vdc	Ambient Temperature Operating (°C)	Pkg. Name
OP4004	625	Phase Lock Loop	700	3%	12ps	40ma	-40 to +85	Dip 16-8
OP4005	622.08	Phase Lock Loop	700	3%	12ps	40ma	-40 to +85	Dip 16-8
OP4006	666.51	Phase Lock Loop	700	3%	12ps	40ma	-40 to +85	Dip 16-8

High Performance PLL for use in Stratom Clocks

Typical Jitter
10ps p-p

OP4005 622.08 MHz Phase Noise

- Quartz SAW Stabilized and Filtered
- Fundamental-Mode Oscillation at 625.00 MHz
- Voltage Tunable for Phase Lock Loop Operations

The output of this device is generated and filtered by narrowband quartz SAW elements at 625.00 MHz. The configuration of this clock is intended to provide a pure signal for Optical Clocking applications in noisy signal environments. The Q/Qbar differential output swing of ± 1 volt about 0 vdc has symmetry better than $\pm 1\%$ into loads from 40 ohms to 70 ohms; determined by customer application. The long term frequency accuracy is determined by a external reference source allowing this device to complete a Phase Lock Loop design without the usual noise and jitter problems associated with PLLs.

Absolute Maximum Ratings

Lid Symbolization (YY=Year, WW=Week)		RFM OP4004 YYWW					

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling. COCOM CAUTION: Approval by the U.S. Department of Commerce is required prior to export of this device.

Notes:

1. Unless otherwise noted, all specifications include any combination of load VSWR, V_{CC} , and T_A . In addition, Q and $\bar{Q}$ are terminated into 50 Ω loads to ground. See *Typical Test Circuit*.
2. One or more of the following United States patents apply: 4,616,197; 4,670,681; 4,760,352.
3. The design, manufacturing process, and specifications of this device are subject to change without notice.
4. Only under the nominal conditions of 50 Ω load impedance with VSWR ≤ 1.2 and nominal power supply voltage.
5. Symmetry is defined as the pulse width (in percent of total period) measured at the 50% points of Q or $\bar{Q}$. (See: Timing Definitions.)
6. Jitter and other spurious outputs induced by externally generated electrical noise on V_{CC} or mechanical vibration are not included in this specification. External voltage regulation and careful PCB layout are recommended for optimum performance.
7. Applies to period jitter of Q and $\bar{Q}$. Measurements are made with the Tektronix CSA803 signal analyzer with at least 1000 samples.
8. Linearity is a function of the percentage variation from a permitted linear deviation versus the amount of frequency tune range. See *Linearity Definition*.

RFM's Other Product Lines

About RF Monolithics, Inc.

Since 1983, RF Monolithics, Inc. (RFM) has pioneered the use of advanced surface acoustic wave (SAW) and RF technology in short-range wireless data systems. RFM ships more than 50 million products annually to customers in 40 countries for short-range wireless applications in the industrial, computing, consumer electronic and automotive markets. The Company's product offerings for short-range wireless applications range from discrete SAW devices to the 2nd generation ASH transceiver hybrids. RFM's extensive experience and customer support structure is unparalleled in the short-range wireless industry.

RFM was founded in 1979 and became public in 1994 (NASDAQ - RFMI). The Company's headquarters are located in its 95,000 square foot facility in Dallas, Texas USA. For further information see RFM's web site at www.rfm.com or contact the Company at USA (972) 448-3700.

RFM's Other Product Lines

RF Monolithics, Inc. has additional product lines serving many different electronics markets including automotive, communications, consumer, home automation, and industrial.

Frequency Control Modules

RFM's frequency control modules include high-frequency digital clocks and analog, quartz-stabilized oscillators. These SAW-based products cover a frequency range from 200 MHz to 1.3 GHz. As broadband telecommunication systems demand more performance to support Internet requirements, bandwidth becomes the key element that allows information to flow efficiently. RFM's "Diff Sine" technology provides the necessary performance for high-speed digital telecommunication systems. "Diff Sine" products are available in fixed frequency or tunable technology to serve different application needs. Each technology will help eliminate system noise present in broadband telecommunications and provide clean timing to maximize throughput around the system's backbone. Our analog products provide a clean, single-ended local oscillator for air traffic control systems, identification friend or foe (IFF) systems and communications systems for various applications.

Low-power Products

RFM's Low-power Products Group combines Low-power Components and Virtual Wire® Short-range Radio products. Low-power Components consist of surface-mount and leaded package resonators and coupled-resonator filters. These resonators and coupled-resonator filters are essential to tiny radio frequency transmitters and receivers that enable a variety of wireless consumer, automotive, industrial and commercial applications. Some of these devices include remote keyless entry, wireless security systems and remote meter readers. Due to the superior performance of our surface-mount resonators, RFM is one of the world's largest manufacturers of these products.

The Virtual Wire® Short-range Radio products provide integrated one- and two-way solutions for short-range wireless control and data communication applications. These products are based on RFM's patented second-generation amplifier-sequenced hybrid (ASH) technology and include miniature transmitters, receivers, and transceivers. Using this technology, wireless communication links can be implemented in products as small as a watch. Furthermore, Virtual Wire® products greatly simplify the design and regulatory certification of short-range radio systems. RFM's short-range radio systems are used in home automation applications, tire pressure monitoring, RFID tags, wireless game controllers, and several new market applications.
